Number 29 ■ October 26, 2010

## National Hospital Discharge Survey: 2007 Summary

by Margaret Jean Hall, Ph.D.; Carol J. DeFrances, Ph.D.; Sonja N. Williams, M.P.H.; Aleksandr Golosinskiy, M.S.; and Alexander Schwartzman, Division of Health Care Statistics

### Abstract

**Objectives**—This report presents national estimates of hospital inpatient care in the United States during 2007 and selected trend data. Numbers and rates of discharges, diagnoses, and procedures are shown by age and sex. Average lengths of stay are presented for all discharges and for selected diagnostic categories by age and by sex.

**Methods**—The estimates are based on data collected through the 2007 National Hospital Discharge Survey, an annual national probability sample survey of discharges from nonfederal, general, and short-stay hospitals. Sample data are weighted to produce annual estimates of inpatient care, excluding newborns. Diagnoses and procedures are coded using the *International Classification of Diseases, Ninth Revision, Clinical Modification*.

**Results**—In 2007, there were an estimated 34.4 million hospital discharges, excluding newborns. The total hospitalization rate leveled off from 1995 to 2007 after declining during the period from 1980 to 1995. Throughout the period from 1970 to 2007 the rates for those aged 65 years and over were significantly higher than the rates for the younger groups.

Although those aged 65 years and over accounted for only 13 percent of the total population, they comprised 37 percent of hospital discharges and 43 percent of hospital days. One-quarter of inpatients under age 15 years were hospitalized for respiratory diseases. There were 45 million inpatient procedures during 2007 and 15 percent of these were cardiovascular. Males aged 45–64 and 65 years and over had higher cardiac catheterization rates than females in these age groups each year from 1997 to 2007. From 2002 to 2007 the rate of inpatient cardiac catheterization procedures declined.

**Keywords:** inpatients • diagnoses • procedures • ICD-9-CM

### Introduction

This report presents data from the 2007 National Hospital Discharge Survey (NHDS). The survey has been conducted continuously by the Centers for Disease Control and Prevention's National Center for Health Statistics (NCHS) since 1965. NHDS is the principal source for national data on the characteristics of discharges from nonfederal short-stay hospitals. National estimates of hospital use derived from NHDS are published annually by NCHS. This report provides an overview of the 2007 data ([Table 1](#)), and includes the number and rate of discharges and average lengths of stay by age and by sex of patients for selected diagnoses ([Tables 2–7](#)). Average lengths of stay are also presented for selected diagnostic categories. Estimates of the number and rate of selected procedures performed on hospital inpatients are shown by age and by sex ([Tables 8–11](#)). Detailed data from NHDS for earlier years have been published annually in Series 13 of *Vital and Health Statistics* (1). Trend data from NHDS have been included in annual *Health, United States* reports (2). NHDS data have been used in articles examining important topics of interest in public health and health services

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES  
Centers for Disease Control and Prevention  
National Center for Health Statistics

research (3–7). A list of NCHS and selected other publications using NHDS data is available at [http://www.cdc.gov/nchs/nhds/nhds\\_products.htm](http://www.cdc.gov/nchs/nhds/nhds_products.htm).

Estimates of the number of procedures shown in this report are for inpatients only. Surgery and other medical procedures are performed in a variety of other health care settings that are covered by the National Health Care Surveys. Data from these surveys have been published (8–12). Reports and more information about the surveys can be found at: <http://www.cdc.gov/nchs/nhcs.htm>.

## Methods

### Data source

NHDS collects data from a sample of inpatient records acquired from a national sample of hospitals. Because persons with multiple discharges during the year may be sampled more than once, estimates are for discharges, not persons. Only hospitals with an average length of stay of fewer than 30 days for all patients, and general hospitals and children's general hospitals are included in the survey. Federal, military, and Department of Veterans Affairs hospitals, as well as hospital units of institutions, such as prison hospitals, and hospitals with fewer than six beds staffed for patient use, are excluded.

Prior to 1988, NHDS was based on a two-stage design. The survey was redesigned in 1988 (13) and thereafter used a modified, three-stage design. Units selected at the first stage consist of either hospitals or geographic areas, such as counties, groups of counties, or metropolitan statistical areas in the 50 states and the District of Columbia. Within a sampled geographic area, hospitals are selected. Finally at the last stage, systematic random sampling is used to select discharges within sampled hospitals. Until 2003, the hospital sampling frame for the redesigned survey was constructed from the SMG Hospital Market Database (14). In 2003 and 2006, the sample frame was constructed from the products of Verispan, L.L.C., specifically their "Healthcare Market Index," and their

"Hospital Market Profiling Solution" (15). These two products were formerly known as the SMG Hospital Market Database. The hospital sampling frame and sample are updated every 3 years (13).

For 2007, the sample consisted of 501 hospitals, of which 24 were found to be out of scope (ineligible) because they had gone out of business or otherwise failed to meet the criteria for NHDS universe. Of the 477 in-scope (eligible) hospitals, 422 responded to the survey for an unweighted response rate of 88 percent. The weighted response rate was 82 percent. Data were collected for approximately 366,000 discharges.

The survey includes a sample of discharges from January 1 through December 31, 2007. NHDS data collection is authorized under Section 306 of the Public Health Service Act (Title 42 U.S. Code, 242k). Participation is voluntary. Data collected in NHDS are consistent with the Privacy Rule of the Health Insurance Portability and Accountability Act (HIPAA). No personally identifying information, such as patient's name, address, or Social Security number, is collected in NHDS. All information collected is held in the strictest confidence according to law, including the Confidential Information Protection and Statistical Efficiency Act (Title 5 of PL 107–347). Approval for the 2007 NHDS protocol was renewed by the NCHS Research Ethics Review Board in 2007. Waivers of the requirements to obtain informed consent of patients and patient authorization for release of patient medical record data by health care providers were granted.

Two data collection procedures are used in the survey. One is a manual system in which sample selection and medical transcription from the hospital records to abstract forms are performed by the hospital's staff or by staff of the U.S. Census Bureau on behalf of NCHS. The other data collection procedure is an automated system in which NCHS purchases electronic medical record data from commercial organizations, state data systems, hospitals, or hospital associations, and then systematically samples these data. Whether a particular hospital's data are obtained manually or

from these electronic sources is determined in accordance with agreements with individual hospitals. In 2007, approximately 45 percent of respondent hospitals provided data through the automated system. A detailed report on the design and operation of NHDS has been published (13). The medical abstract form ([Figure I](#)) and the automated data contain items that relate to the personal characteristics of the patient. These items include birth date (converted to age), sex, race, ethnicity, marital status, ZIP Code, and expected sources of payment. Administrative items, such as admission and discharge dates, admission type and source, and discharge status, are also included. Admitting diagnosis and a present on admission checkbox for all of the diagnosis variables were added to the data hospitals were required to collect for billing effective in the last quarter of 2007 only. Although these data items were included in the 2007 NHDS data collection, they are not reported in the NHDS 2007 data file because it was not possible to make full year estimates based on 3 months of data. The medical information about patients includes up to seven discharge diagnoses, as many as four surgical and nonsurgical operations and procedures, and dates of surgery. Medical data are coded according to the *International Classification of Diseases, Ninth Revision, Clinical Modification* (ICD–9–CM) (16). In 2002, the ICD–9–CM Coordination and Maintenance Committee created Chapter 00, Procedures and Interventions Not Elsewhere Classified, as a way of handling space limitations in the existing hierarchical structure. For the 2003–2005 NHDS data, this new chapter was included in the miscellaneous diagnostic and therapeutic procedures and new technologies category shown in reports for those years in [Tables 8–11](#). Beginning with the 2006 NHDS report, the 00 codes that had previous code assignments in other chapters were included in the categories and chapters of their previous codes to make longitudinal analyses of these conditions easier for researchers. For

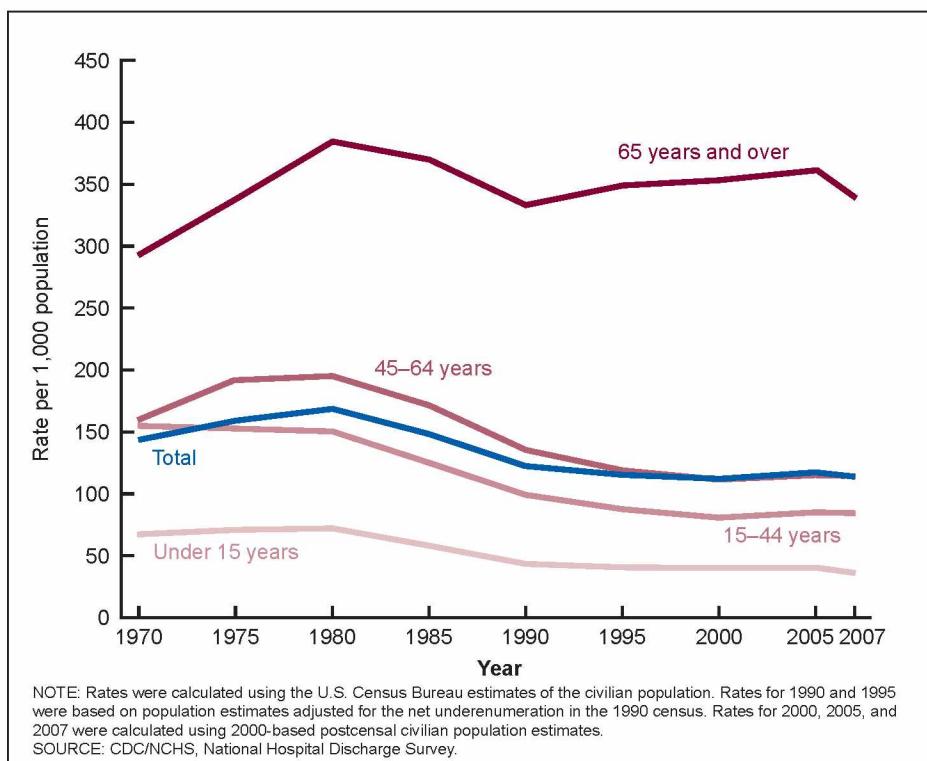

example, “Balloon angioplasty of coronary artery or coronary atherectomy” had been reassigned ICD-CM-9 code 00.66, but it was included with other operations on the cardiovascular system.

The NHDS contractor for coding and entry of the data from the abstracts gathered through manual data collection, conducts an ongoing quality control program. As part of this program, approximately 10 percent of the abstracts are independently recoded, with discrepancies resolved by a chief coder. The overall error rate for records manually coded for the 2007 data year was 0.2 percent for medical (ICD-9-CM) coding and keying combined and was also 0.2 percent for demographic coding and keying combined.

## Results

### Patient and hospital characteristics

- The total hospitalization rate leveled off from 1995 to 2007 after declining during the period from 1980 to 1995. Throughout the entire period from 1970 to 2007, the rates for those aged 65 years and over were significantly higher than those for the younger age groups (Figure 1).
- In 2007, an estimated 34.4 million inpatients, excluding newborn infants, were discharged from nonfederal short-stay hospitals in the United States (Table 1).
- The discharge rate was 1,143.9 per 10,000 population: 936.7 for males and 1,344.0 for females (Table 1). This difference was largely driven by the 15–44 year-old female’s discharge rates (1,247.7 per 10,000 population) compared with male’s discharge rates (449.8 per 10,000 population) in this same age group. It is primarily in the 15–44 year-old group that most of the hospitalizations for childbirth occurred. Males had an average length of stay of 5.3 days compared with 4.6 days for females (Table 1).
- The discharge rate per 10,000 population ranged from 947.8 in the West to 1,347.9 in the Northeast region. The average length of stay

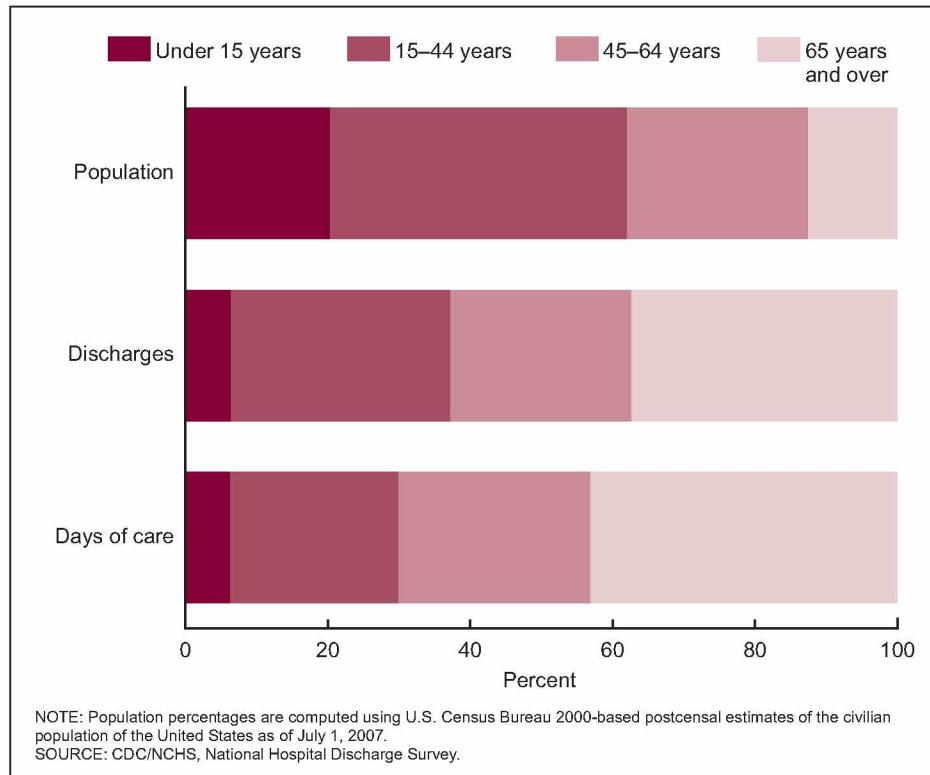

**Figure 1. Hospitalization rates, by age: United States, 1970–2007**

ranged from 4.3 days in the Midwest and West to 5.8 days in the Northeast region (Table 1).

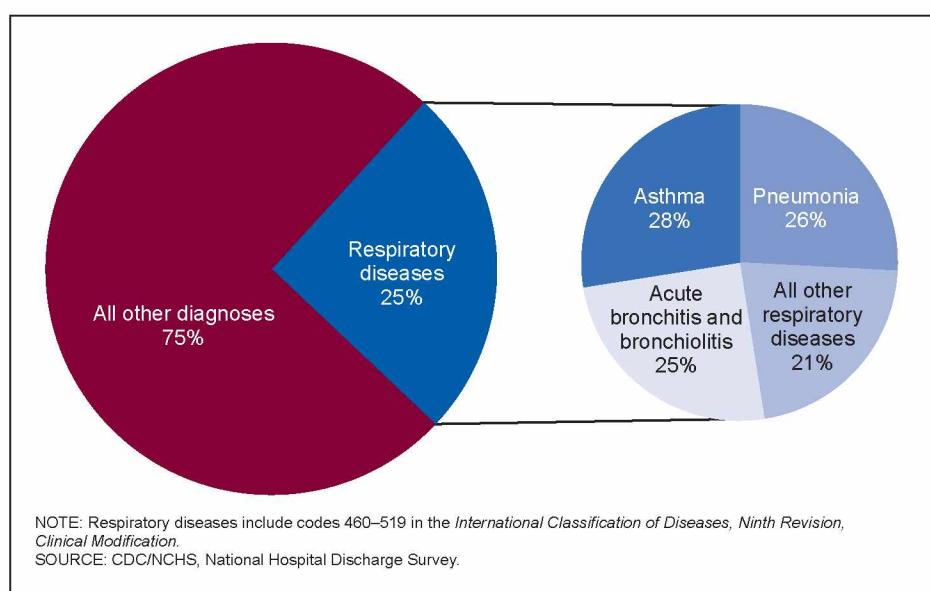

- In 2007, those aged 65 years and over accounted for just 13 percent of the U.S. population, but 37 percent of the hospital discharges, and 43 percent of the days of care. In contrast, 15–44 year-olds comprised 42 percent of the population and 31 percent of the hospital discharges, but only 24 percent of the days of care. Children under age 15 years who made up 20 percent of the population, were only 6 percent of the hospitalizations and used only 6 percent of the days of care (Figure 2).
- The average length of stay for those aged 65 years and over was 5.6 days; for those 45–64 years, it was 5.1 days; for those 15–44 years, it was 3.7 days; and for children under age 15 years, it was 4.7 days (Table 1).
- Six diagnostic categories together accounted for 13.1 million or about 38 percent of all discharges. These were delivery (4.1 million), heart disease (4.0 million), psychoses (1.7 million), malignant neoplasms (1.2 million), pneumonia (1.1 million), and fractures (1.0 million) (Table 2).
- Overall, the average length of stay was 4.8 days, but it was 2.6 days for delivery, 4.4 days for heart disease, 5.0 days for pneumonia, 5.1 days for fractures, 6.5 days for malignant neoplasms, and 7.5 days for psychoses (Table 4).
- Of the 1.0 million discharges hospitalized for fractures, more than one-half (531,000) were aged 65 years and over (Table 2). Those 65 years and over had 140.2 discharges per 10,000 population with a first-listed diagnosis of fracture (Table 3), and the average length of stay for these discharges was 5.6 days (Table 4). Almost one-half of the fracture hospitalizations for this age group were for hip fractures (fractures of neck of femur).
- Among children under age 15 years, respiratory diseases were responsible for a quarter of all hospitalizations.

### Diagnoses

- Six diagnostic categories together accounted for 13.1 million or about

**Figure 2. Distribution of civilian population, hospital discharges, and days of care, by age: United States, 2007**

**Figure 3. Hospitalization for respiratory diseases among children under age 15 years: United States, 2007**

Asthma, pneumonia, and acute bronchitis and bronchiolitis were the first-listed diagnoses for over three quarters of these hospitalizations (Figure 3).

- About one-fifth (4.1 million) of female discharges were for childbirth (Table 5).
- About 15 percent (2.1 million) of male discharges and 9 percent (1.8

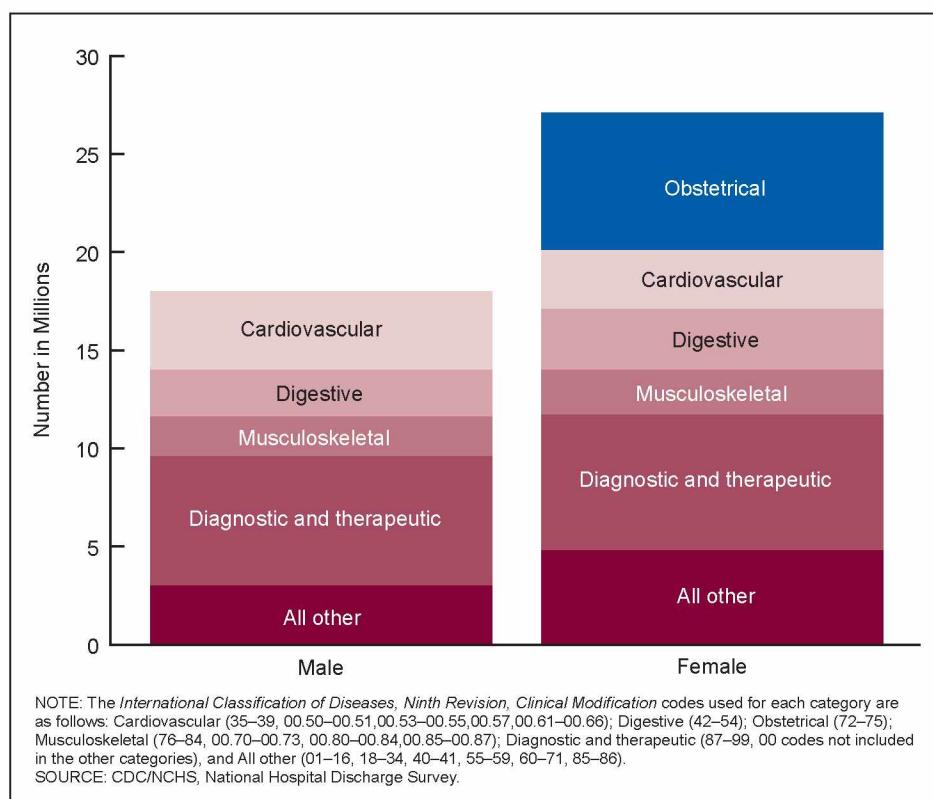

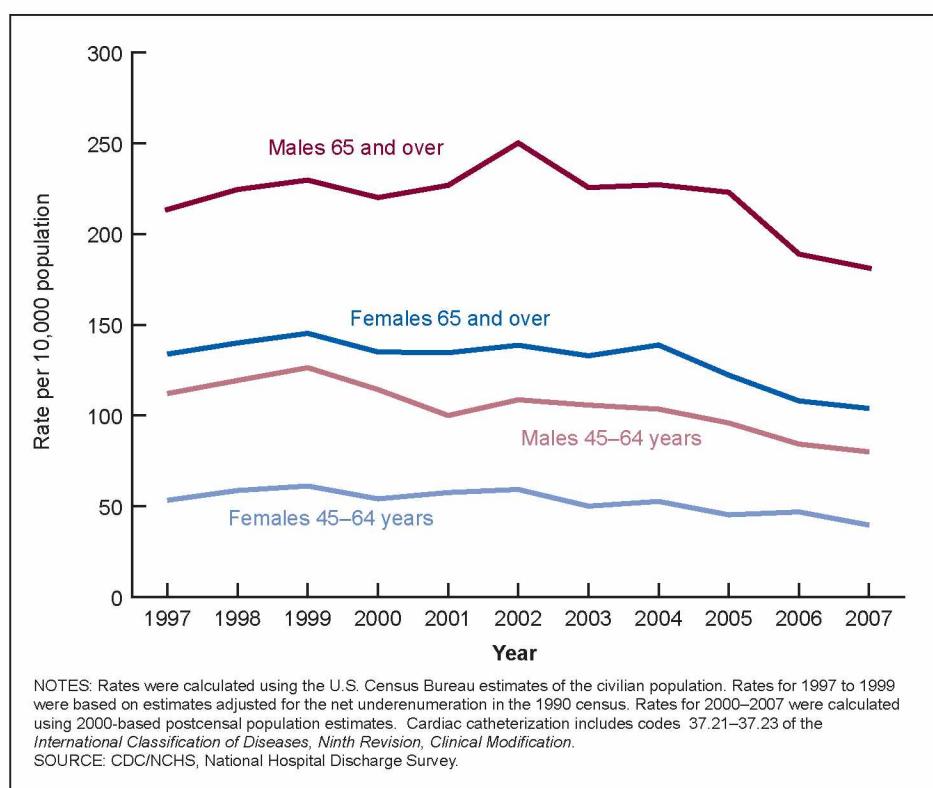

million) of female discharges were for heart disease (Table 5).

## Procedures

- During 2007, 45.0 million procedures were performed on hospital inpatients (Table 8). Nationally, the rate of procedures was 1,497.4 per 10,000 population (Table 9). For males, this rate was 1,216.4 per 10,000 population and for females it was 1,769.1 per 10,000 population (Table 11).
- About 4 million procedures, which was over one-fifth of all procedures performed on males, were cardiovascular (Table 10, Figure 4). For females, about 3 million of their procedures—11 percent—fell into this category (Table 10 and Figure 4).
- The rate of cardiovascular procedures was also higher for males (268.4 per 10,000 population) than for females (195.0 per 10,000 population) (Table 11).
- Over 1 million inpatient cardiac catheterization procedures were performed in 2007 and more than 90 percent of them were on patients aged 45 years and over (Table 8).
- Males aged 65 years and over, and those 45–64 years, had higher cardiac catheterization rates than females in the same age groups for each of the years from 1997 to 2007. The rate of inpatient cardiac catheterization procedures declined during the time period from 2002 to 2007 (Figure 5).
- About 26 percent of all procedures performed on females were obstetrical (Figure 4). Cesarean section and repair of current obstetric laceration were the most frequent obstetrical procedures performed (Table 10).
- Females had more operations on the digestive system than males (3.1 million compared with 2.4 million) (Table 10 and Figure 4). Similarly, the rate of digestive procedures was more for females (202.2 per 10,000 population) than for males (161.5 per 10,000 population) (Table 11).

<sup>1</sup>SE is standard error.

<sup>2</sup>In 2002, the Chapter 00 codes were established. For reporting purposes, between 2003 and 2005, all Chapter 00 codes were grouped with the miscellaneous diagnostic and therapeutic procedures and new technologies category. Beginning in 2006, the 00 codes are included in the categories and chapters of their previous codes, where applicable. See Data source.

<sup>3</sup>The number of discharges with a coronary artery bypass graft was 232,000.

<sup>4</sup>Chapter 00 codes included in this category: 00.01–00.03, 00.09, 00.10–00.18, 00.21–00.25, 00.28–00.29, 00.31–00.35, 00.39, 00.40–00.43, 00.45–00.48, 00.52, 00.56, 00.74–00.76, 00.91–00.93.

## Technical Notes

### Estimation

Because of the complex multistage design of NHDS, the survey data must be inflated or weighted in order to produce national estimates. The estimation procedure produces essentially unbiased national estimates, and has three basic components: inflation by reciprocals of the probabilities of sample selection, adjustment for nonresponse, and population weighting ratio adjustments. These three components of the final weight are described in more detail in another report (13).

The standard error is primarily a measure of sampling variability that occurs by chance because only a sample rather than the entire universe is surveyed. Estimates of the sampling variability for this report were calculated with SUDAAN software, which takes into account the complex sample design. A description of the software and the approach it uses has been published (17). The standard errors of statistics presented in this report are included in each of the tables.

### Use of tables

Discharges are reported by first-listed diagnosis, which is the one specified as the principal diagnosis on the face sheet or discharge summary of the medical record or, if a principal diagnosis is not specified, the first one listed on the face sheet or discharge summary of the medical record. It is usually the main cause of the hospitalization. The number of first-listed diagnoses is the same as the number of discharges.

Estimates of procedures include surgical or nonsurgical operations, diagnostic procedures, and special treatments reported on the medical record. Up to four procedures are coded for each discharge. All-listed procedures include all occurrences of the procedure coded regardless of the order on the medical record. Definitions of the terms used in this report have been published (1).

The diagnoses and procedures appear in separate tables of this report, presented by chapter of the ICD-9-CM. Within these chapters, subcategories of diagnoses or procedures are shown. These specific categories were selected primarily because of the large number of discharges or because they are of special interest. Data for newborn infants, defined as patients admitted to a hospital by birth, are excluded from this report.

Because of low reliability, estimates with a relative standard error of more than 30 percent or those based on a sample of fewer than 30 records are replaced by asterisks (\*). The estimates that are based on 30–59 patient records are preceded by an asterisk (\*) to indicate that they also have low reliability.

Estimates are rounded to the nearest thousand. Therefore, figures within tables do not always add to the totals. Rates and average lengths of stay are calculated from unrounded figures and may not precisely agree with rates or average lengths of stay calculated from rounded data.

Discharge rates were calculated by dividing the number of discharges by the U.S. civilian population and then multiplying by the unit reported, for example, when reporting rate per 10,000 population, multiply by 10,000. Rates are computed using adjustments made after the 2000 census (postcensal estimates) of the civilian population of the United States as of July 1, 2007. The data are from unpublished tabulations provided by the U.S. Census Bureau.

This is the seventh year that NHDS publications have used rates calculated from the 2000 census. The rates for NHDS reports on 1991–2000 data were computed using postcensal estimates of the civilian population based on the 1990 census. Population estimates for the civilian population from the 2000 census were not available until after the 2000 NHDS reports were prepared.

A weighted least squares regression method (18) was used to test the significance of time trends shown in Figures 1 and 5, or mentioned in the text. Differences mentioned between

2007 NHDS estimates were tested using the two-sided *t*-test. Terms that express differences such as higher, lower, largest, smallest, leading, increased, or decreased, were only used when the differences were statistically significant at the 0.05 level.

OMB No. 0920-0212

FORM <b>HDS-1</b> (3-20-2008)	U.S. DEPARTMENT OF COMMERCE Economics and Statistics Administration U.S. CENSUS BUREAU ACTING AS COLLECTING AGENT FOR DEPARTMENT OF HEALTH AND HUMAN SERVICES CENTERS FOR DISEASE CONTROL AND PREVENTION NATIONAL CENTER FOR HEALTH STATISTICS	<b>MEDICAL ABSTRACT NATIONAL HOSPITAL DISCHARGE SURVEY</b>																																						
<b>Notice</b> — All information which would permit identification of an individual or an establishment will be held confidential, will be used only by persons engaged in and for the purposes of the survey, and will not be disclosed or released to other persons or used for any other purpose. Public reporting burden of this collection of information is estimated to average 4 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to CDC/ATSDR Reports Clearance Officer; 1600 Clifton Road, MS D-74, Atlanta, GA 30333, ATTN: PRA (0920-0212).
